Skyscan atomic clock manual 31420e

Top critical reviewAll critical reviews› Ivan Kruglak1.0 out of 5 starsUseless travel clockReviewed in the United States on February 18, 2011"Ahhh" I thought, "A travel clock that automatically adjusts time zones, how handy". Totally wrong in this case. Well, actually right. It does adjust time zones, just not the right direction! What is worse, the clock can be set manually for the correct time, but then, some hours later, typically in the middle of the night, it decides that it knows better and changes your clock's time--back in my case, so that the time in one instance was an hour earlier (it read 5 AM instead of 6 AM--when I had to get up to catch a plane). Then, I traveled further West to California and it decided to set itself back by 2 hours. A broken clock is more accurate--at least it's correct twice a day! It does have a manual time zone set feature and will cycle between E,C M & P, but I swear that the automatic set feature overrules it! This also defeats the purpose of having an auto-set clock. Further thoughts: this clock is on the large size for a travel clock and it's not easy to adjust. The time display is decent, and I like having a temperature display too. The orange back light is on the dim side and some rubber feet would be nice to prevent it marring a tabletop and not slipping when touched. My recommendation: forget buying a travel clock with atomic time setting. You'll never be certain it is going to act correctly and consistently. Perhaps other brands work more reliably than this one, but how will you know? What happens if you travel outside the US? Atomic clocks keep time better than any other clock. They even keep time better than the rotation of the Earth and the movement of the stars. Without atomic clocks, GPS navigation would be impossible, the Internet would not synchronize, and the position of the planets would not be known with enough accuracy for space probes and landers to be launched and monitored.Atomic clocks are not radioactive. They do not rely on atomic decay. Rather, they have an oscillating mass and a spring, just like ordinary clocks.The big difference between a standard clock in your home and an atomic clock is that the oscillation in an atomic clock is between the nucleus of an atom and the surrounding electrons. This oscillation is not exactly a parallel to the balance wheel and hairspring of a clockwork watch, but the fact is that both use oscillations to keep track of passing time. The oscillation frequencies within the atom are determined by the mass of the nucleus and the gravity and electrostatic "spring" between the positive charge on the nucleus and the electron cloud surrounding it. If you have read How GPS Receivers Work, you know that atomic clocks are extremely important to the system. You also frequently hear about atomic clocks in ads for the new clocks that automatically synchronize themselves with the atomic clock in Boulder, Colorado. Atomic clocks are also important to a variety of scientific endeavors.So let's start with the general notion of a clock. A clock's job is to keep track of the passage of time. All clocks do this by counting the "ticks" of a "resonator."In a pendulum clock, the resonator is a pendulum and the gears in the clock keep track of time by counting the resonations (the swingings back and forth) of the pendulum. The pendulum usually resonates at a frequency of one swing per second. A digital clock uses either the oscillations on the power line (60 cycles per second in the United States, 50 cycles per second in Europe) or the oscillations of a quartz crystal as the resonator, and counts using digital counters. The accuracy of the clock is determined by the accuracy of the resonator at the specified frequency.An atomic clock is a clock that uses the resonance frequencies of atoms as its resonator. According to Encyclopedia Britannica, the resonator is "regulated by the frequency of the microwave electromagnetic radiation emitted or absorbed by the quantum transition (energy change) of an atom or molecule." (See the National Institute of Standards and Technology for a diagram and description of the process.)The advantage of this approach is that atoms resonate at extremely consistent frequencies. If you take any atom of cesium and ask it to resonate, it will resonate at exactly the same frequency as any other atom of cesium. Cesium-133 oscillates at 9,192,631,770 cycles per second. This sort of accuracy is completely different from the accuracy of a quartz clock. In a quartz clock, the quartz crystal is manufactured so that its oscillating frequency is close to some standard frequency; but manufacturing tolerances cause every crystal to be slightly different, and things like temperature will change the frequency. A cesium atom always resonates at the same known frequency -- that is what makes atomic clocks so precise.Here are some interesting links: 1 Insert two AA, LR6 1.5 volt alkaline batteries in the battery compartment of the clock. Align them in the compartments based on the polarity marked on the clock’s compartment case. The clock will search for a signal once the batteries are installed. Wait at least 15 minutes for the temperature to display on the clock before setting it.[1] 2 Slide the time zone switch on the back of the clock or press the time zone button.[2] The time zone will flash and at that point, you can input the desired time zone by pressing and releasing the "+" key. PST is Pacific Standard Time, MST is Mountain Standard Time, CST is Central Standard Time, and EST is Eastern Standard Time. Advertisement 3 Begin to manually set the time on your clock. Slide the Daylight Saving Time switch to "On" if you are in Daylight Savings Time. Switch it to "Off" if it is not Daylight Savings Time.[3] This option may not be available on all clocks. 4 Set the time on your clock with your desired hours. After adjusting the time zone and daylight savings (as described in the previous step), the hour digit on the clock will start to flash automatically. Press and release the "+" key until it’s the at the desired hour. Press "SET" to secure the time.[4] The minute digits will begin to flash once the hour digit has been set in place. Press and release the "+" key until it’s at the right minute. Press and release the "SET" key to move to setting the "year". Repeat this action to set the month, date, weekday, 12/24H time format, and temperature setting. Remember that if set properly, SkyScan clocks are able to set themselves. So although you can manually set the time, understand that the time may change accurately on its own and void your manual efforts. 5 Place your atomic clock near a window, away from metal and concrete structures. Leave it for at least four minutes so that it can find the signal. It will automatically search for a signal at 2 AM for eight minutes each night.[5] Advertisement 1 Set one to three of the transmitters on the clock/weather station. Transmitters display the current humidity and temperature indoors and outside that the remote unit monitors. Remove the transmitter from the stand and unscrew the battery door of the transmitter. Place two AAA batteries in each battery compartment.[6] 2 Assign a channel to each transmitter you plan to use. Receivers can receive temperature and humidity data from up to three transmitters at a time, as reflected by assigned channels. Once channels have been assigned to a transmitter, they can only be changed by removing the batteries and resetting the transmitter over again.[7] Slide the switch inside of the battery compartment for each transmitter you’re using. There will be a switch for Channel 1, 2, and Channel 3 respectively. 3 Confirm the channel setting by pressing the "Reset" button. The "Reset" button is inside the battery compartment using a small pin. Slide the C/F switch inside of the compartment for centigrade or Fahrenheit. Replace and screw in the battery cover. 4 Avoid placing the transmitter in rain, snow or direct sunlight. The clock on the transmitters and weather station will be controlled via radio signal. You can also press "Reset" to recalibrate the unit. 5 Remove the battery cover on the back of your weather station monitor.[8] The weather station monitor is the part of the clock that displays time, time zone, and weather, as received by the transmitter set up in previous steps. Insert the three AA batteries into the back. Make sure to use the plus and minus symbols to ensure the correct polarity of the batteries. Replace the battery cover onto the back of the weather station. Press the "Reset" button to restart the clock of the weather station. The channels of the transmitter will sync automatically. 6 Select the time zone. The clock’s default time zone is Pacific, but if you are not in that time zone, select your real time zone. Press and hold the button labeled "Time" for two seconds. The hour will flash. Use the up and down keys to change the hour to the correct hour.[9] To change the time in the correct order of hour-minute-second-12/24 hour-year-month-date-day language, press the time key for two seconds followed by the up and down arrows to adjust the time. Repeat this action one at a time for each time component. Choose PA/P for Pacific, MO/M for Mountain, CE/C for Central, or EA/E for Eastern. Press the "Time" key again to exit the time setting mode. Advertisement 1 Insert 1 fresh AA, LR6 1.5 volt battery into the analog clock battery holder. Insert a second AA, LR6 1.5 volt battery into the digital clock.[10] Ensure that you insert the battery according to the right polarity on the battery. This is indicated by the plus and minus signals on the case and on the battery. 2 Close the battery cover. Mount the clock to stand in an upright position near a window so that it can search and receive a signal. The clock will either receive a WWVB signal to set itself to the exact time within five minutes of exposure or it will determine that a signal cannot be received due to the location or time of day.[11] 3 Press the time zone button. Select the time zone that you are in. The SkyScan atomic clock can only collect the correct signal from 2,000 miles (3,200 km) away, so it must be set to the correct zone to get an accurate reading. Press and hold one of the four time zone buttons MT-Mountain Time, CT-Central Time, ET-Eastern Time, and PT-Pacific Time. Clocks tend to automatically default to a Pacific area time zone. If you are in the Pacific area time zone, hang up your clock. If not, use one of the buttons to make the setting correct. 4 Set the clock by the window. If you choose to manually set the hands, be aware that it will still gather a signal and adjust the time periodically, overriding manual set ups. Once the SkyScan clock picks up the signal from the NIST station, it will advance by eight seconds until it gets the right signal. Advertisement Add New Question Question Why does the clock keep blinking? You need to reset the time. If the time is incorrect, it will keep blinking until you fix it. Question How can I change it to Fahrenheit without changing any other settings? Try pressing the clock’s “Set” button repeatedly until the “C” on the clock flashes, then click the “+” button to change it to “F.” Alternately, see if there is a button within the transmitter that enables you change the transmitter’s F/C setting. Question What do the letters LUN mean on an atomic wall clock? “LUN” may mean "set the clock to display the lunar (moon) phase." If it says “LON,” it means the time zone is set to show time in London, England, which is on Universal Coordinated Time (UTC). Question You said I should install a second battery into the digital clock. How? Some clocks are designed so that the batteries are inserted in a straight line, but sometimes only one can be seen. If only one battery is inserted, it will slide back and forth. Slide it completely into the hidden area, then put the other battery in right behind it, facing the same way. Be sure that proper polarity is observed when inserting them: the flat end is negative (-), the raised bump end is positive (+). Other clocks have the batteries inserted side-by-side and both should be easily visible. They are normally inserted in opposite directions, though there are a few exceptions. Question The second hand keeps spinning and doesn't stop. What should I do? Turn the clock off. You can do this by switching the on/off button on the back. Question How do I change the time zone if I only have alarm-wave-mode and + and - buttons? Your phone should say the time, but to use the plus-minus buttons it should say in the instruction handbook on how to set up. Question How can I set it to Fahrenheit without changing the other settings? Click the settings button, then click the temperature and change it to Fahrenheit. Ask a Question Advertisement Thanks!
